Project Definition

In this phase, students have the opportunity to demonstrate proficiency in the following SLOs:

- CO5: Communicate the project vision statement clearly.
- PR4: Create a prototype of a software system to validate a set of requirements.
- T1. Follow effective team communication practices.
- T4. Collaborate effectively in cooperative development/programming.
- TE3. Identify configuration items and use a source code control tool in a small team-based project.
- SC1. Write appropriate unit tests for a small component (several functions, a single type, etc.).

Deliverables, by the end of this phase:

- **Monorepo (TE3)**
  - Configure your team's monorepo correctly, mirroring the organization of the CS 262 sample monorepo.
  - Make sure all members can contribute to the monorepo -- i.e., add them as contributors/owners.
  - Add your professor (github id: VictorNorman) as a contributor with full rights.

- **Vision Statement (CO5)**

  - Write a vision statement for your team project. A vision statement is a short (usually a 1-2 paragraph) summary of the high-level requirements and the business case for a project. It should be both clear and compelling. Jeff Atwood gives some useful guidance on creating and delivering vision statements: Can Your Team Pass the Elevator Test? Include a brief, comparative analysis of other related/competing systems.
  - Publish your statement and a list of your team members in the `README.md` file for your monorepo in GitHub (e.g., CS 262 sample project) and be prepared to deliver a one-minute, project pitch presentation in class.
  - NOTE: this SLO will be regraded if you wish to revise your Vision Statement after the end of this phase.

- **Prototype (PR4)**

  - Create a simple client application for your team project. Implement 1 or 2 key screens -- perhaps the introductory "landing" screen, and a key first screen that includes some data. Mock the data by hard-coding it in the client app itself. Make sure you have tests implemented to cover everything you have implemented so far.
  - Push this application to your client/ directory on GitHub. You will use this as the main repo for your client throughout the semester. Be prepared to demo this prototype.

- **Management/Communication Tools (TE5)**

- **Microsoft Teams: (**these instructions are for one pair of members of the team) In Microsoft Teams, create a Team called 26FA-CS262-Team-<Name>. When you create it, choose "From template" and then choose "Other".

  Create these channels in the team:

  - `General` — this one will be created for you. It is for general communication, e.g.: meeting planning; announcements; …
  - `Watercooler` — for tangential but interesting or fun posts
  - `Stakeholders` — a channel for communication to and from stakeholders

  Feel free to add other channels for special discussions, e.g.: client; server; platform-specific hacking; …

  Add all your team members AND your professor to the team.

- **GitHub Project Board:** (these instructions are for one pair of members of the team) In GitHub, go to your Teams repo, and set up a Project. In the Project, create a Board view. Configure your board as shown in this sample board, using x==1. Familiarize yourselves with the structure of this board before going on.
  - Create a field called Task Types, with these choices:
    - management: make it green
    - development: make it blue
    - quality: red
    - analysis/design: purple
  - Add a card to your board named “Configure Project Board” under the “Sprint 1: Doing” column. Make it a management task (green) and attach the appropriate team members. When you’re finished with this exercise, move it to the “Sprint 1: Done” column.

- **Team Contract (T4)**
  Create a team contract as defined here.

NOTE TO VTN2: Need to grade:

- Team contract: are everyone's names in it? is it linked to from the readme? (T4)
- Project board setup: all categories setup? (T1)
- teams setup: are all channels setup? (T1)
- prototype: is it in the correct place? Are there tests? Are there at least 2 pages/routes?
- vision statement: is it complete?
- monorepo setup: are the directories all set up? (TE3)
- README.md format/setup (TE3)
